Work packages and topics

Goals

- improve productivity
- bring software engineering closer to HPC

Topics

- determination of concepts
- benefit of data analytics
- benefit of in-situ visualization
- compiler-assisted development
- code co-development

Goal: motivate HPC users to

- use an integrated development environment (IDE) (eclipse)
- use the IDE for debugging
- employ automated testing (unit testing)

Interesting tool found

- Visual Studio Code (open source)
 - plugins for: bash, Fortran, ...
 - full screen debugging based on gdb

Motivation

HPC hardware and its operation are costly

resources are requested in abstract terms

compute time, storage/archive capacity

- Iimited feedback on resource utilization
- \rightarrow users and even experts are often not aware of cost

Goals

- Raise performance awareness by providing cost feedback
- ightarrow reduce overall cost and increase scientific output
- ightarrow help to make decisions on optimization effort

| Introduction 00 | Perf. engineering | | Certification | Tuning 00000 | | Conclusion |
|--------------------|-------------------|--|---------------|-----------------|--|------------|
| Approach and tasks | | | | | | |

- model cost of resources (storage, compute, ...)
- integrate cost models into workload manager
- deploy feedback tools on production systems

| Introduction | Perf. engineering | Perf. awareness 00●000 | Certification | Tuning 00000 | Conclusion O |
|--------------|-------------------|---------------------------|---------------|-----------------|-----------------|
| Cost m | odels | | | | |

Simple model

devide total machine cost by node hours

Refined model

- procurement costs: compute, storage, infrastructure
- operational costs: energy, service, staff

Example data

- compute: $0.33 \in \text{to } 0.47 \in \text{(per node hour)}$
- disk: 12.80 € (per month and TB)

Write-up

https://wr.informatik.uni-hamburg.de/_media/research/projects/pecoh/d3_1-and-d3_3-modelling-hpc-usage-costs.pdf

Introduction Perf. engineering Perf. awareness Certification Tuning Dissemination Conclusion o

Cost modelling: a simple example

Question: What is the value of optimization?

Assumptions

- unoptimized run needs 10,000 node hours
- the optimizing scientist costs 60 k€ per year
- Example alternatives
 - 1 run code as is
 - 2 spend an hour to make code run 2% faster
 - 3 spend a day to make code run 5% faster

Introduction Perf. engineering Perf. awareness Certification Tuning Dissemination Conclusion o

Cost modelling: a simple example

Question: What is the value of optimization?

Assumptions

- unoptimized run needs 10,000 node hours
- the optimizing scientist costs 60 k€ per year
- Example alternatives
 - 1 run code as is
 - 2 spend an hour to make code run 2% faster
 - 3 spend a day to make code run 5% faster

Answer: alternative 2 leads to lowest cost

- **s**aving: 200 node hours \approx 66 \in
- investment: one working hour pprox 36€
- total cost: 1. ≈ 3300€, 2. ≈ 3270€, 3. ≈ 3423€

Introduction of the engineering of the engineering

We studied practical options to give feedback

- compute Time → SLURM epilogue
- online storage → daily/monthly reporting
- archive space → instrumentation of archiving commands

Scripts that use cost models were implemented

- script 1: job cost estimation
 - read a cost model configuration
 - analyse SLURM jobs accordingly
- script 2: statistical analysis of finished jobs
 - computes averages, std-deviations and quantiles

Introduction Perf. engineering Perf. awareness Certification Tuning Dissemination Conclusion

- most user representatives don't find it necessary to provide cost information for every batch job
- some users would like to be able to convert between compute and storage resources according to their cost

Motivation

HPC-Führerschein

(corresponds to a Golf Proficiency Certificate in Singapore)

- provide HPC beginners with basic skills required for using HPC clusters
- check success by self testing
- HPC certification program
 - provide HPC teaching material at all levels
 - establish HPC certificates (like other IT certificates)
 - HPC-Certification Forum started

ightarrow http://hpc-certification.org

- listing and classification of competences
- development of a certification program
- creation of workshop material
- provision of an online tutorial
- enabling an online examination

Introduction Perf. engineering Perf. awareness Certification Tuning Dissemination Conclusion oo oo oo oo oo oo oo oo oo

Listing and classification of HPC competences

Main topics

- general HPC knowledge
- performance engineering
- software engineering
- use of the HPC environment

Roles

- tester (running programs)
- builder (compiling programs)
- developer (writing programs)

Levels

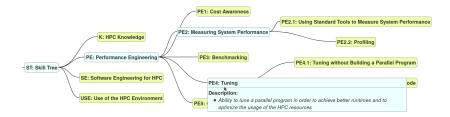

basic, intermediate, expert

Result

https://www.hhcc.uni-hamburg.de/files/hpccp-concept-paper-180601.pdf

The main topics are subdivided into a skill tree:

→ https://www.hhcc.uni-hamburg.de/en/hpc-certification-program/hpc-skill-tree.html

H.Stüben et al.

Performance Engineering Workshop, TU Dresden, March 2019

| | Perf. engineering | Perf. awareness 000000 | Certification 0000●0 | Tuning 00000 | Conclusion O |
|-------|-------------------|---------------------------|-------------------------|-----------------|-----------------|
| Views | | | | | |

Our framework allows creation and selection of *views* on the skill tree, e.g.

- basic tester
- (intermediate) developer
- groups of users (chemists, climate researches, ...)
- analogy: targets and dependences in *Makefiles*

Introduction Perf. engineering Perf. awareness Certification Tuning Dissemination Conclusi

Markdown

- easy to use lightweight markup language, widely used for documentation purposes (e.g. on GitHub)
- plain text editor is sufficient
- supports formulae, syntax-highlighting, tables, hyperlinks, inclusion of images
- content of a single skill is based on a list of Markdown files
- Extensible Stylesheet Language Transformations (XSLT)
 - XSLT-programs generate Makefiles for Pandoc from skill tree (XML) and contents (Markdown)

Pandoc

- convertions between many markup formats
- used to convert .md-skill content files to .html, .pdf, .tex

Introduction Perf. engineering Perf. awareness Certification Tuning Dissemination Conclusion occord Strain Conclusion occ

Goals

- provide settings for tuning parameters
 - runtime settings
 - e.g. \$TMPDIR, process placement, thread number
 - compile time settings
 - e.g. compiler flags, libraries

Approach and tasks

- determination of tuning possibility (from manuals)
- setup of realistic use cases (cooperation with users)
- benchmarking (with use cases)
- documentation (success stories)

Compile time settings

- use OpenBLAS or MKL (slightly better than OpenBLAS)
- -O3 delivered best performance
- no benefit from profile guided optimization
- use at least simple parallelization via foreach()

| Introduction | Perf. engineering | | Certification | Tuning ○○●○○ | Conclusion |
|--------------|-------------------|-----|---------------|-----------------|------------|
| Tuning | results fo | r R | | | |

Use case A: "R Benchmark 2.5" [Simon Urbanek]

- mix of matrix operations (cross product, eigenvalues) and other parts (recursions, loops)
- single process speedup: \approx 4 using MKL
- \blacksquare parallel speedup with OpenMP: $\approx 15\,\%$

Use case B: parallelization of regression analysis

- speedup \approx 30 on 4 nodes \times 16 cores (64 cores)
- Use case C: analysis of satellite night images
 - parallelization with foreach()
 - speedup: 126 on 32 nodes × 4 cores (128 cores) no domain decomposition → every process has all data

Problem: reading of compressed files with CDI is slow Analysis: slowdown due to libaec and GribAPI

GribAPI is hard to change

Solution: parallelization of decoding Result:

- significant speedup on compressed data
- slight slowdown on uncompressed data
 - caches become less effective, overheads are significant
- decoding is concurrent to further processing steps

| | Perf. engineering | Perf. awareness 000000 | Certification | Tuning oooo● | Conclusion O |
|-------|-------------------|---------------------------|---------------|-----------------|-----------------|
| Measu | rements | | | | |

Test case: copy data from one file to another

Memory size: 113GB (double), file size: 28GB (short), compressed: 13GB

| | cor | mpressed | uncompressed | | |
|----------------------|--------------|-----------------------|--------------|-----------------------|--|
| | time | throughput | time | throughput | |
| sequential input | 334 <i>s</i> | 340 ^{MB} /s | 66 <i>s</i> | 1710 ^{MB} /s | |
| ightarrowdisk access | 5 <i>s</i> | 2600 ^{мв} /s | 25 <i>s</i> | 1120 ^{мв} /s | |
| ightarrowdecoding | 329 <i>s</i> | 343 ^{MB} /s | 41 <i>s</i> | 2756 ^{мв} /s | |
| parallel input | 66 <i>s</i> | 1710 ^{MB} /s | 89 <i>s</i> | 1269 ^{MB} /s | |
| ightarrowdisk access | 27 <i>s</i> | 481 ^{MB} /s | 57 <i>s</i> | 491 ^{MB} /s | |
| ightarrowoverheads | 41 <i>s</i> | 2756 ^{мв} /s | 33 <i>s</i> | 3424 ^{MB} /s | |
| parallel decoding | 462 <i>s</i> | 244 ^{MB} /s | 141 <i>s</i> | 801 ^{MB} /s | |

Cache effects heavily influence many values Overheads are mostly extra memcpy() calls
