# 1 Hadoop Ecosystem

- Hortonworks
- Cloudera
- Supporting Tools

## 2 Supporting Tools

## 3 More Frameworks

## 4 Summary

# Hortonworks

## Hortonworks Data Platform

### GOVERNANCE & INTEGRATION

#### Data Workflow, Lifecycle & Governance

Falcon  
Sqoop  
Flume  
NFS  
WebHDFS

### DATA ACCESS

**Batch**  
Map  
Reduce

**Script**  
Pig

**SQL**  
Hive/Tez  
HCatalog

**NoSQL**  
HBase  
Accumulo

**Stream**  
Storm

**Others**  
In-Memory  
Analytics  
ISV Engines

### YARN : Data Operating System

### HDFS

(Hadoop Distributed File System)

### DATA MANAGEMENT

### SECURITY

#### Authentication Authorization Accounting Data Protection

Storage: HDFS  
Resources: YARN  
Access: Hive, ...  
Pipeline: Falcon  
Cluster: Knox

### OPERATIONS

#### Provision, Manage & Monitor

Ambari  
Zookeeper

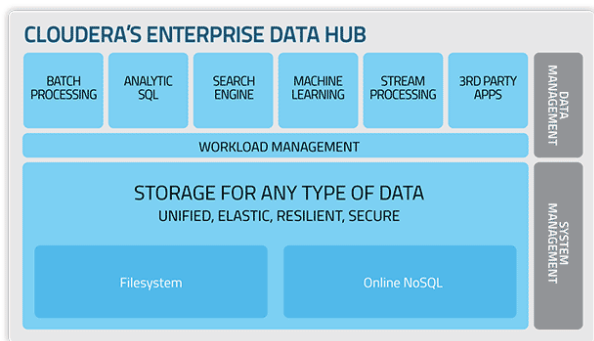

#### Scheduling

Oozie

# Cloudera Enterprise Hadoop Ecosystem [25]

- Cloudera offers support, services and tools around Hadoop
- Unified architecture: common infrastructure and data pool for tools
- Build with open-source

Source: [26]

# Supporting Tools<sup>1</sup>

- Ambari: A Tool for Managing Hadoop Clusters
- Hue: Manage „BigData“ projects in a browser
- ZooKeeper: coordination/configuration service for services
- Sqoop: ETL between HDFS and structured data stores
- Oozie: Workflow scheduler (schedules/triggers workflows)
- Falcon: Data governance engine for data pipelines
- Flume: collecting, aggregating and moving large streaming event data
- Kafka: publish-subscribe distributed messaging system
- Knox: REST API gateway (for all services)
- Ranger: Integrate ACL permissions into Hadoop (ecosystem)
- Slider: YARN application supporting monitoring and dynamic scaling of non-YARN apps

## 1 Hadoop Ecosystem

## 2 Supporting Tools

- Ambari
- Hue
- Zeppelin
- Oozie
- Falcon
- Sqoop
- Slider
- Knox
- Atlas

## 3 More Frameworks

## 4 Summary

# Ambari: A Tool for Managing Hadoop Clusters

- Convenient tool managing 10+ Apache tools
- Supports installation and management
  - Dealing with data dependencies
  - Service startup
  - Monitoring of health and performance
  - (Re)configuration of services

# Management with Ambari: Configuration

# Hue [12]: Lightweight Web Server for Hadoop

- Manage BigData projects in a browser
- Supports: Hadoop ecosystem
  - HDFS, Pig, Sqoop, Hive, Impala, MapReduce, Spark, ...

## Features

- Data upload/download
- Management of HCatalog tables
- Query editor (Hive, Pig, Impala)
- Starting and monitoring of jobs

# Hue: Lightweight Web Server for Hadoop

The screenshot displays the Hue Oozie-Dashboard interface. At the top, there is a navigation bar with 'HUE' logo and various menu items like 'Query Editors', 'Data Browsers', 'Workflows', 'Suche', 'Security', 'Datei-Browser', 'Job-Browser', and '51emfu'. Below this is a sub-navigation bar with 'Oozie-Dashboard', 'Workflows', 'Coordinators', 'Bundles', 'SLA', and 'Oozie'. The main content area has a search bar and several action buttons: 'Fortsetzen', 'Unterbrechen', 'Beenden', 'Nur Folgende anzeigen', and 'Tage mit Status'. The 'Aktiv' section is currently empty, showing 'Keine Daten verfügbar' and '0 bis 0 von 0 Einträgen werden angezeigt'. The 'Abgeschlossen' section contains a table of completed jobs.

Monitoring Oozie Workflows (Live system on gethue.com)

# Hue: Lightweight Web Server for Hadoop

The screenshot shows the Hue web interface. At the top, there's a navigation bar with 'Datei-Browser', 'Job-Browser', and '51emffu'. Below that, there's a search bar and several dropdown menus. The main content area shows a file browser view for the user '51emffu'. The interface includes a search bar, a 'Nach Dateinamen suchen' input, and several action buttons like 'Aktionen', 'In Papierkorb verschieben', 'Hochladen', and 'Neu'. The file list is as follows:

<input type="checkbox"/>	Größe	Benutzer	Gruppe	Berechtigungen	Datum
<input type="checkbox"/>		hdfs	supergroup	drwxr-xr-x	September 17, 2015 02:46 AM
<input type="checkbox"/>		51emffu	51emffu	drwxr-xr-x	September 17, 2015 02:39 AM
<input type="checkbox"/>		51emffu	51emffu	drwx----	September 17, 2015 02:46 AM
<input type="checkbox"/>		51emffu	51emffu	drwxr-xr-x	September 17, 2015 02:40 AM

At the bottom, there's a pagination bar showing 'Anzeigen 45 von 2 Elemente' and 'Seite 1 of 1' with navigation arrows.

File browser (Live system on [gethue.com](http://gethue.com))

# Hue: Lightweight Web Server for Hadoop

The screenshot displays the Hue web interface for editing a Hive query. The top navigation bar includes 'HUE', 'Query Editors', 'Data Browsers', 'Workflows', 'Suche', 'Security', 'Datei-Browser', 'Job-Browser', and '51emfu'. The main content area is titled 'Hive Editor' and 'Abfrage-Editor'. A query editor on the left contains the following SQL code:

```
1 SELECT * FROM sample_08
2 WHERE salary < 100000
```

Below the query editor are buttons for 'Ausführen', 'Speichern unter...', 'Erklären', and 'Neue Abfrage'. The results section shows a table with columns: 'sample\_08.code', 'sample\_08.description', 'sample\_08.total\_emp', and 'sample\_08.salary'. The table contains 7 rows of data.

	sample_08.code	sample_08.description	sample_08.total_emp	sample_08.salary
0	00-0000	All Occupations	135185230	42270
1	11-1031	Legislators	64650	37960
2	11-2011	Advertising and promotions managers	36100	94720
3	11-3011	Administrative services managers	246930	79500
4	11-3041	Compensation and benefits managers	38810	93410
5	11-3042	Training and development managers	29350	93830
6	11-3051	Industrial production managers	154030	91200

Query editor (Live system on gethue.com)

# Hue: Lightweight Web Server for Hadoop

Visualizing query results in diagrams (Live system on gethue.com)

# Zeppelin [39]

- Web-based notebook for interactive data analytics
  - Add code snippets
  - Arrange them
  - Execute them
  - Visualizes results
- Supports Spark, Scala, psq|, R
- Collaborative environment
- Can be embedded into a webpage
- A bit premature (currently incubating)

# Oozie [15, 16]

- Scalable, reliable and extensible workflow scheduler
- Jobs are DAGs of actions specified in XML workflows
- Actions: Map-reduce, Pig, Hive, Sqoop, Spark, Shell actions
- Workflows can be parameterized
  - Triggers notifications via HTTP GET upon start/end of a node/job
  - Automatic user-retry to repeat actions when fixable errors occur
  - Monitors a few runtime metrics upon execution
- Interfaces: command line tools, web-service and Java APIs
- Integrates with HCatalog
- Coordinator jobs trigger jobs
  - By time schedules
  - When data becomes available
    - Requires polling of HDFS (1-10 min intervals)
    - With HCatalog's publish-subscribe, jobs can be started immediately
  - Can record events for service level agreement

# Workflows [16]

- A workflow application is a ZIP file to be uploaded
  - Includes workflow definition and coordinator job
  - Bundles scripts, JARs, libraries needed for execution
- Workflow definition is a DAG with control flow and action nodes
  - Control flow: start, end, decision, fork, join
  - Action nodes: whatever to execute
- Variables/Parameters <sup>2</sup>
  - Default values can be defined in a config-default.xml in the ZIP
- Expression language functions help in parameterization<sup>1</sup>
  - Basic functions: `timestamp()`, `trim()`, `concat(s1, s2)`
  - Workflow functions: `wf:errorCode(< action node >)`
  - Action specific functions:  
`hadoop:counters("mr-node")["FileSystemCounters"]["FILE_BYTES_READ"]`
- Coordinator job is also an XML file

---

<sup>2</sup>They are used with with `${NAME/FUNCTION}`, e.g. `${timestamp()}`

# Coordinator Jobs [17]

App which periodically starts a workflow (every 60 min)

```

1 <coordinator-app name="MY_APP" frequency="60" start="2009-01-01T05:00Z" end="2009-01-01T06:00Z" timezone="UTC"
  ↪ xmlns="uri:oozie:coordinator:0.1">
2   <action>
3     <workflow>
4       <app-path>hdfs://localhost:9000/tmp/workflows</app-path>
5     </workflow>
6   </action>
7 </coordinator-app>

```

Every 24h check if dependencies for a workflow are met, then run it

```

1 <coordinator-app name="MY_APP" frequency="1440" start="2009-02-01T00:00Z" end="2009-02-07T00:00Z" ...>
2   <datasets> <-- check for existence of this URI -->
3     <dataset name="input1" frequency="60" initial-instance="2009-01-01T00:00Z" timezone="UTC">
4       <uri-template>hdfs://localhost:9000/tmp/revenue_feed/{YEAR}/{MONTH}/{DAY}/{HOUR}</uri-template>
5     </dataset>
6   </datasets>
7   <input-events> <-- we depend on the last 24 hours input data -->
8     <data-in name="coordInput1" dataset="input1">
9       <start-instance>${coord:current(-23)}</start-instance>
10      <end-instance>${coord:current(0)}</end-instance>
11    </data-in>
12  </input-events>
13  <action>
14    <workflow>
15      <app-path>hdfs://localhost:9000/tmp/workflows</app-path>
16    </workflow>
17  </action>
18 </coordinator-app>

```

# Example Oozie Workflow [13]

Three actions: Execute pig script, concatenate reducer files, upload files to a remote via ssh

```

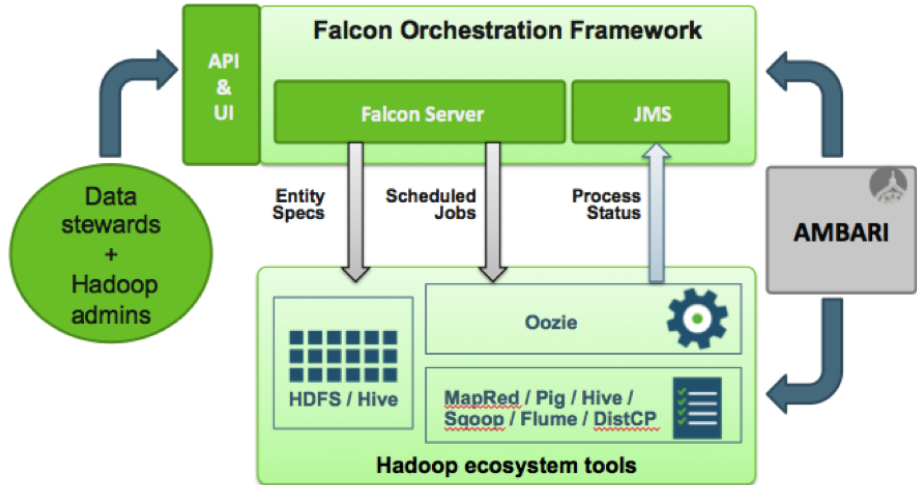

1 <workflow-app xmlns="uri:oozie:workflow:0.2" name="sample-wf">
2   <start to="pig" />
3   <action name="pig">
4     <pig><job-tracker>${jobTracker}</job-tracker>
5     <name-node>${nameNode}</name-node>
6     <prepare><delete path="${output}"/></prepare>
7     <configuration>
8       <property> <name>mapred.job.queue.name</name><value>${queueName}</value></property>
9       <property> <name>mapreduce.fileoutputcommitter.marksuccessfuljobs</name><value>true</value></property>
10    </configuration>
11    <script>${nameNode}/projects/bootcamp/workflow/script.pig</script>
12    <param>input=${input}</param>
13    <param>output=${output}</param>
14    <file>lib/dependent.jar</file>
15    <pig><ok to="concatenator" /><error to="fail" /> <-- the concatenator action is not shown here -->
16  </action>
17
18  <action name="fileupload">
19    <ssh><host>localhost</host>
20    <command>/tmp/fileupload.sh</command>
21    <args>${nameNode}/projects/bootcamp/concat/data-${fileTimestamp}.csv</args><args>${wf:conf("ssh.host")}</args>
22    <capture-output/></ssh>
23    <ok to="fileUploadDecision" /><error to="fail"/>
24  </action>
25
26  <decision name="fileUploadDecision"> <-- check the exit status of the file upload -->
27    <switch><case to="end">${wf:actionData('fileupload')['output']} == '0'</case><default to="fail"/> </switch>
28  </decision>
29
30  <kill name="fail"><message>Workflow failed, error message[${wf:errorMessage(wf:lastErrorNode())}]</message></kill>
31  <end name="end" />
32 </workflow-app>

```

# Falcon [11,13]

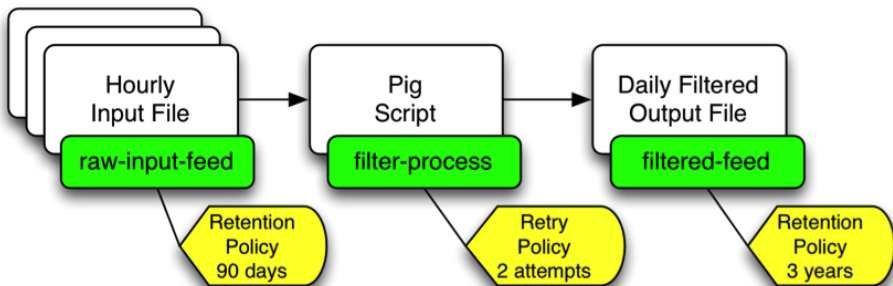

- Feed (data set) management and processing system
- Simplifies dealing with many Oozie jobs
- Provides data governance
  - Define and run data pipelines (management policies)
  - Monitor data pipelines
  - Trace pipelines to identify dependencies and perform audits
- Data model defines entities describing policies and pipelines
  - Clusters define resources and interfaces to use
  - Feeds define frequency, data retention, input, outputs, retry and use clusters (multiple for replication)
  - Process: processing task, i.e. Oozie workflow, Hive or Pig script
- Features
  - Supports reuse of entities for different workflows
  - Enables replication across clusters and data archival
  - Supports HCatalog
  - Notification of users upon availability of feed groups

# Falcon: High-level Architecture

Source: [11]

# Falcon: Example Pipeline

Source: [11]

# Falcon: Example Process Definition [11, 14]

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <!-- Sample process. Runs at 6th hour every day. Input: last day hourly data. Output: for yesterday -->
3 <process name="SampleProcess">
4   <cluster name="wr" />
5   <frequency>days(1)</frequency>
6
7   <validity start="2015-04-03T06:00Z" end="2022-12-30T00:00Z" timezone="UTC" />
8
9   <inputs>
10     <input name="input" feed="SampleInput" start="yesterday(0,0)" end="today(-1,0)" />
11   </inputs>
12
13   <outputs>
14     <output name="output" feed="SampleOutput" instance="yesterday(0,0)" />
15   </outputs>
16
17   <properties>
18     <property name="queueName" value="reports" />
19     <property name="ssh.host" value="host.com" />
20     <property name="fileTimestamp" value="${coord:formatTime(coord:nominalTime(), 'yyyy-MM-dd')}" />
21   </properties>
22
23   <workflow engine="oozie" path="/projects/bootcamp/workflow" />
24
25   <retry policy="backoff" delay="minutes(5)" attempts="3" />
26
27   <-- How to check and handle late arrival of input data-->
28   <late-process policy="exp-backoff" delay="hours(1)">
29     <late-input input="input" workflow-path="/projects/bootcamp/workflow/lateinput" />
30   </late-process>
31 </process>

```

# Sqoop [18, 19]

- Transfers bulk data between Hadoop and RDBMS, either
  - One/multiple tables (preserving their schema)
  - Results of a free-form SQL query
- Uses MapReduce to execute import/export jobs
  - Parallelism is based on splitting one column's value
- Validate data transfer (comparing row counts) for full tables
- Save jobs for repeated invocation
- Main command line tool sqoop, more specific tools sqoop\*

# Features [19]

## Import Features

- Incremental import (scan and add only newer rows)
- File formats: CSV, SequenceFiles, Avro, Parquet
  - Compression support
- Outsource large BLOBS/TEXT into additional files
- Import into Hive (and HBase)
- Can create the table schema in HCatalog automatically
  - With HCatalog, only CSV can be imported

## Export Features

- Bulk insert: 100 records per statement
- Periodic commit after 100 statements

# Import Process [19]

- Read the schema of the source table
- Create a Java class representing a row of the table
  - This class can be used later to work with the data
- Start MapReduce to load data parallel into multiple files
  - The number of mappers can be configured
  - Mappers work on different values of the splitting column
  - The default splitting column is the primary key
    - Determines min and max value of the key
    - Distributes fixed chunks to mappers
- Output status information to the MapReduce job tracker

# Example Imports [19]

```
1 # Import columns from "foo" into HDFS to /home/x/foo (table name is appended)
2 # When not specifying any columns, all columns will be imported.
3 $ sqoop import --connect jdbc:mysql://localhost/db --username foo --table TEST --columns
   ↳ "matrikel,name" --warehouse-dir /home/x --validate
4
5 # We'll use a free-form query, it is parallelized on the split-by column
6 # The value is set into the magic $CONDITIONS variable
7 $ sqoop import --query 'SELECT a.*, b.* FROM a JOIN b on (a.id == b.id) WHERE
   ↳ $CONDITIONS' --split-by a.id --target-dir /user/foo/joinresults
8
9 # To create the HCatalog table use --hcatalog-table or --hive-import
10 # See [19] for details of the available options
```

# Slider [20]

- Is a YARN application that manages non-YARN apps on a cluster
- ⇒ Utilize YARN for resource management
- Enables installation, execution, monitoring and dynamic scaling
- Command line tool `slider`
- Apps are installed and run from a package
  - Tarball with well-defined structure [21]
  - Scripts for installing, starting, status, ...
- Example packages: `jmemcached`, `HBase`
- Slider is currently extended to deploy Docker images

# Knox: Security for Hadoop [22]

- REST API Gateway for Hadoop ecosystem services
  - Supports: HDFS, Hcatalog, HBase, Oozie, Hive, Yarn, Storm
  - Supports multiple clusters
- Provides authentication, federation/SSO, authorization, auditing
- Enhances security providing central control and protection
  - SSL encryption
  - Authentication: LDAP, Active Directory, Kerberos
  - Authorization: ACL's (user, group, IP) on service level<sup>3</sup>

Source: [22]

# Example Accesses via the REST API [22]

## List a HDFS directory

```
1 curl -i -k -u guest:guest-password -X GET
   ↪ 'https://localhost:8443/gateway/sandbox/webhdfs/v1/?op=LISTSTATUS'
```

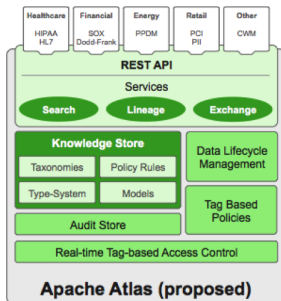

## Example response

```
1 HTTP/1.1 200 OK
2 Content-Type: application/json
3 Content-Length: 450
4 Server: Jetty(6.1.26)
5
6 {"FileStatuses":{"FileStatus":[
7 {"accessTime":0,"blockSize":0,"group":"hdfs","length":0,
   ↪ "modificationTime":1350595859762, "owner":"hdfs", "pathSuffix":"apps",
   ↪ "permission":"755", "replication":0,"type":"DIRECTORY"},
8 {"accessTime":0,"blockSize":0, "group":"mapred","length":0,
   ↪ "modificationTime":1350595874024, "owner":"mapred", "pathSuffix":"mapred",
   ↪ "permission":"755", "replication":0,"type":"DIRECTORY"},
9 ]}}
```

# Atlas [23]

- A proposed<sup>4</sup> framework for platform-agnostic data governance
- Exchange metadata with other tools
- Audit operations, explore history of data and metadata
- Support lifecycle management workflows built with Falcon
- Support Ranger access control (ACL's)

Source: [23]

---

<sup>4</sup>It is already shipped with Ambari

1 Hadoop Ecosystem

2 Supporting Tools

3 More Frameworks

- Drill
- Impala
- Solr
- Mahout

4 Summary

# Drill [10, 29, 30]

- Software framework for data-intensive distributed applications
- Data model: relational (ANSI SQL !) + schema-free JSON
- Analyse data in-situ without data movement
  - Execute one query against multiple NoSQL datastores
  - Datastores: HBase, MongoDB, HDFS, S3, Swift, local files
- Features
  - REST APIs
  - Columnar execution engine supporting complex data
  - Locality-aware execution
  - Cost-based optimizer pushing processing into datastore
  - Runtime compilation of queries

```
1 # Different datastores, localstorage, mongodb and s3
2 SELECT * FROM dfs.root.'/web/logs';
3 SELECT country, count(*) FROM mongodb.web.users GROUP BY country;
4 SELECT timestamp FROM s3.root.'clicks.json' WHERE user_id = 'jdoe';
5
6 # Query JSON: access the first students age from private data (a map)
7 SELECT student[0].private.AGE, FROM dfs.'students.json';
```

# Cloudera Impala [25, 26]

- Enterprise analytic database
  - Utilizes HDFS, HBase and Amazon S3
  - Based on Google Dremel like Apache Drill
- Written in C++, Java
- Massively-parallel SQL engine
  - Supports HiveQL and subset of ANSI-92 SQL
- Uses LLVM to generate efficient code for queries

# Solr [10, 31]

- Full-text search and indexing platform
- REST API: index documents and query via HTTP
  - Query response in JSON, XML, CSV, binary
- Features
  - Data can be stored on HDFS
  - High-availability, scalable and fault tolerant
  - Distributed search
  - Faceted classification: organize knowledge into a systematic order using (general or subject-specific) semantic categories that can be combined for a full classification entry [10]
  - Geo-spatial search
  - Caching of queries, filters and documents
- Uses lucene library for search
- Similar tools: Elasticsearch [33]

# Example Query [32]

## Identifying available facets terms and number of docs for each

```
1 curl http://localhost:8983/solr/gettingstarted/select?wt=json&indent=true&q=*&rows=0&facet=true&facet.field=manu_id_s
```

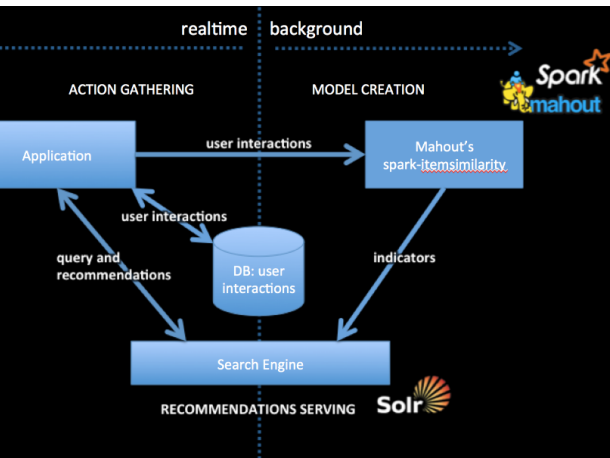

## Response

```
1 {
2   "responseHeader":{
3     "status":0,
4     "QTime":3,
5     "params":{"/* Parameters of the query */
6       "facet":"true", "indent":"true", "q":"*:*", "facet.field":"manu_id_s", "wt":"json",
7       "rows":"0"}},
8   "response":{"numFound":2990,"start":0,"docs":[]}, /* number of documents found */
9   "facet_counts":{
10    "facet_queries":{},
11    "facet_fields":{"/* the available facets and number of documents */
12      "manu_id_s":["corsair",3, "belkin",2, "canon",2, "apple",1, "asus",1, "ati",1, "boa",1, "dell",1, "eu",1, "maxtor",1,
13        ↪ "nor",1, "uk",1, "viewsonic",1, "samsung",0]},
14    "facet_dates":{},
15    "facet_ranges":{},
16    "facet_intervals":{}}
```

# Mahout [34]

- Framework for scalable machine learning
  - Collaborative filtering
  - Classification
  - Clustering
  - Dimensionality reduction
  - Recommender
    - history: user purchases + all purchases  $\Rightarrow$  recommendations (user)
- Computation on Spark, MapReduce, H2O engines [36]
  - Can also use a single machine without Hadoop
  - Algorithm availability depends on the backend
- Bindings for Scala language [35]
  - Provide distributed BLAS, Row Matrix (DRM)
  - R-like DSL embedded in Scala
  - Algebraic optimizer

# Recommender Architecture

Source: [36]

- 1 Collect user interactions  $n \times (\text{user-id, item-id})$
- 2 Learning:
  1. Itemsimilarity creates item, list-of-similar-items
  2. Store those tuples in the search engine
- 3 Query search engine with  $n$  latest user interactions
- 4 If they occur in the list-of-similar-items, recommend item
